

TRADITIONAL MARKETS CLOSE. INFORMATION DOESN'T.

Find what the market knows before the news says it.

PRED is a 24/7 event-intelligence system for tokenized U.S. equities on Bitget. It catches the moves that happen while Wall Street sleeps, and explains them with evidence.

Tokenized stocks trade 24/7. Wall Street trades 6.5 hours.

Closed — tokenized markets still trading

U.S. regular session 9:30–16:00 ET

Closed — tokenized markets still trading

About 73% of every weekday, and all weekend, tokenized equities can react before their home market opens.

Moves come first

A tokenized stock jumps 4% at 3 a.m. No headline, no filing, no analyst note yet.

Alerts are noise

Price alerts fire on everything, including thin order books, and explain nothing.

AI answers are unsourced

Chatbot "analysts" produce confident stories with invented facts. That's a liability with money on the line.

A **Ghost Event** is a move the market made before anyone explained it.

PRED opens one only when all three conditions hold. Anything else is logged with the reason and ignored.

1

Abnormal activity

A statistically large move ($|z| \geq 3.5$) confirmed by volume, on a liquid baseline, not a single trade on an empty book.

2

Wall Street closed

NYSE calendar: nights, weekends, holidays and early closes.

3

Tokenized market live

The Bitget instrument is online and actively trading, with fresh 1-minute data.

Six agents, one lifecycle.

DETECT

Live Bitget 1-min bars
vs a 2-hour baseline

INVESTIGATE

SEC filings, news,
peers, sibling tokens,
BTC/ETH, market
breadth

HYPOTHESIZE

6 competing catalysts,
evidence-weighted
probabilities

VERIFY

Official evidence or
price behaviour,
deadline at the U.S.
open

PREDICT

Reaction range to the
U.S. close from
comparable events

LEARN

Scores direction, range
and catalyst on every
outcome

Transparent, not a black box

Every probability is prior + evidence weights → softmax, capped short of certainty, with a "why N%" breakdown and every revision kept.

LLM as narrator, never as judge

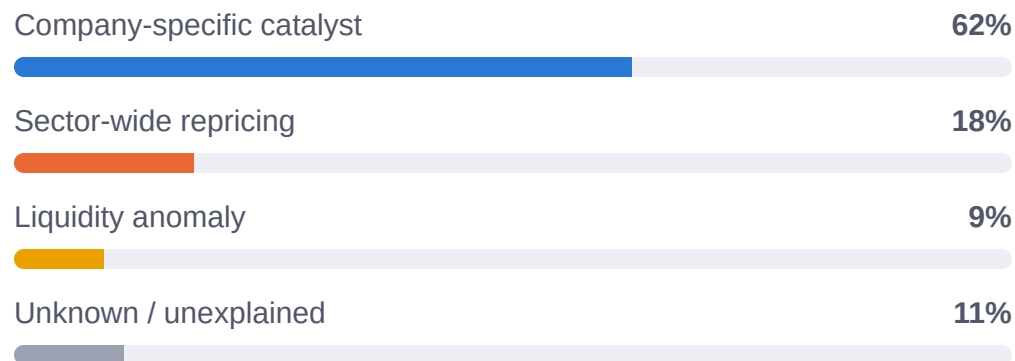

Claude or a Groq-hosted model writes the explanation from PRED's cited evidence only. It never sets numbers, confirms events or trades.

Anatomy of a Ghost Event

GHOST EVENT · ILLUSTRATIVE LAYOUT

NVDA-PERP +4.8%

Volume 9.0× baseline · US market CLOSED · Bitget LIVE

- **Evidence with provenance:** every item has a source, a timestamp and a link. "96% of the move not explained by peers [E7-5]".
- **Live timeline:** detection, investigation, each revision and the resolution, append-only.
- **Catalyst graph** linking the asset, its peers, crypto, filings and news.
- **Resolution:** CONFIRMED by an 8-K, INVALIDATED if it faded before the open, or UNRESOLVED · held.
- **Reaction estimate** only when history supports one; otherwise "insufficient live history".

Live today on real Bitget market data.

336

instruments discovered

Tokenized equities found from Bitget's own metadata (`isRwa`, `symbolType: stock`).
No hard-coded symbols.

219

U.S. stocks monitored

Matched to SEC registrants; polled every 15 s, with 1-minute candles for every name.

24/7

continuous, on Railway

SQLite on a persistent volume, restart-safe, with health checks and honest connection status.

Bitget Unified API v3 for instruments, tickers, candles and order book. **SEC EDGAR** for filings. **GDELT** with an automatic **Google News** backup for news. Zero runtime dependencies, Node.js 22.

Honest by construction.

- **Zero synthetic data in live mode.** Missing fields are shown as n/a, never estimated.
- **Confirmation needs proof:** an official release or a material SEC filing.
- **No false certainty:** probabilities are capped and labelled as model estimates.
- **Self-scoring:** direction, range and catalyst accuracy, plus calibration, on every outcome.
- **Graceful degradation:** sources report CONNECTED, DEGRADED or DISCONNECTED with the real reason.
- **Isolated demo:** a separate, clearly SIMULATED replay for walkthroughs.

Human-approved execution on Bitget.

Agents never trade.

Trade plan → review → approve → order

PRED drafts a sized plan from a Ghost Event: side, quantity at Bitget's precision, stop, target, thesis and evidence. The operator reviews it and must press **Approve & execute** with the exact confirmation phrase.

Safety built in

The server rebuilds and rechecks every order against fresh prices, balance and per-order, per-position and daily limits. One order per plan, even on double clicks. A full audit trail. Disabled by default.

Human-approved execution through Bitget's API is built and tested against a simulated Bitget, and disabled by default. Every order needs explicit human approval, fresh price and balance checks, and cannot be placed twice. Agents cannot trade.

Not a price alert. Not a trading bot.

	PRICE ALERTS	NEWS SUMMARISERS	AI TRADING BOTS	PRED
Catches moves before the news	yes	no	sometimes	yes
Explains the move with sources	no	after the fact	no	yes, cited
Knows when Wall Street is closed	no	no	rarely	NYSE calendar
Honest uncertainty and self-scoring	no	no	no	yes
Human stays in control of money	n/a	n/a	no	always

For anyone holding a stock while its home market sleeps.

Active traders

Off-hours context for tokenized equity moves on Bitget: signal vs noise, in seconds.

Research & risk desks

An auditable record of what moved, when, and what explained it, with calibration data.

Agents & builders

A verified-signal API (`/api/signals`) for downstream, risk-controlled agents.

Roadmap

- **Automatic earnings and corporate calendar** for scheduled catalysts.
- **More authoritative feeds:** investor-relations RSS and exchange notices.
- **Learned evidence weights** once live memory reaches statistical size.
- **Alerts:** webhook and Telegram when a Ghost Event opens or resolves.
- **Bitget Agent Hub:** publish verified signals to external agents.
- **Multi-user execution** with per-user key custody and limits.

DETECT → INVESTIGATE → HYPOTHESIZE → VERIFY → PREDICT → LEARN

The market moves first. PRED tells you why.
